

AVESTHAGEN

BRINGING SCIENCE TO LIFE

If we could patent words
abundance would be one of them.

Since we cannot, we decided to patent ideas instead. 'Environment-Adjusted Crops' being one of them. Our bioAgriculture division develops technologies to combat stresses like drought & salinity, improve productivity and nutritive value of food crops. These technologies reach farmers through our ATASH brand of seeds. Another one of our initiatives will develop biodiesel from Jatropha. This will help reduce global warming and also improve crop productivity.

Avesthagen creates a wealth of good ideas for you. So, you can live in a world that has a cure for diseases. A world where one can prevent disease by eating right. A world that will forget starvation.

We are doing all this to set science free from the confines of a laboratory and see it spread its magic, out in the real world.

Predictive, Preventive, Personalized Healthcare.
